

ABSTRACT OF THE DISCLOSURE

A network scanner device for transmitting image data through networks, includes a reading section for scanning a document to obtain image data, a first setting section for  
5 setting up a recipient address to which the image data is to be transmitted, and a second setting section for setting up a sender address representing a sender in place of a sending station address specifying the device. It also includes a transmission control section for carrying out  
10 control for adding to the image data the sender address set by the second setting section and transmitting the image data to the recipient address set by the first setting section. Thereby, a person having performed an operation of image data transmission is capable of easily using reply  
15 mail and error mail responding to the transmission.
